

Verkehrsbetrieb Stadtwerke Potsdam

Potsdam entdecken mit den touristischen Linien

Straßenbahnen und Busse fahren
Sie direkt und schnell vom Potsdamer
Hauptbahnhof zu den zahlreichen
Sehenswürdigkeiten:

• S1 Schloss Sanssouci Säfte (07.04. bis 05.11.2022)

• S2 Alt-Görlitz

• Sanssouci-Linie

Park und Schloss Sanssouci, Orangerie, Orangeriehaus,
Belvedere auf dem Kranzberg, Weg zum Park Sanssouci

• S2 Glienicker Park
Historisches Dampfmaschinenhaus, Park und Schloss
Charlottenhof, Neues Palais, Weg zum Park Sanssouci

• S2 Campus Jungfernsee

• Volkspark-Linie

Historische Innstadt; Russische Kolonie Alexandrowka,
Volkspark Potsdam

• S2 Jannowitz, Kirchholz

Holländisches Viertel, Russische Kolonie Alexandrowka,
Belvedere auf dem Kranzberg, Ruinenberg, Volkspark
Potsdam, Königin Borissdatt

• S2 Glienicker Brücke

Entwurf, Schiffbauerpasse, Hans Otto Theater, Schloss
und Park Glienicke

Bei Platz der Einheit/West dort umsteigen in:

• S2 Höherstraße

• Ceciliengel-Linie

Historische Innstadt; Russische Kolonie Alexandrowka,
Neuer Garten, Marmorpalais, Schloss Cecilienhof,
Belvedere auf dem Kranzberg
Südost ab Hauptbahnhof (07.04. bis 05.11.2022)

• S2 Johannes Kepler Platz

Filmstadt Babelsberg im Filmpark

A Temporal Graph Model to Predict Chemical Transformations in Complex Dissolved Organic Matter

Philipp Plamper, Oliver J. Lechtenfeld*, Peter Herzsprung, and Anika Groß*

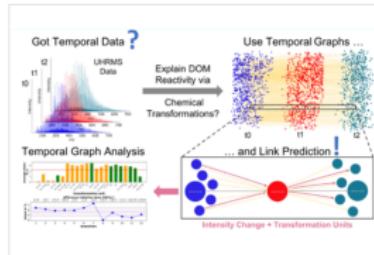

Open PDF

Supporting Information (1)

ACCESS

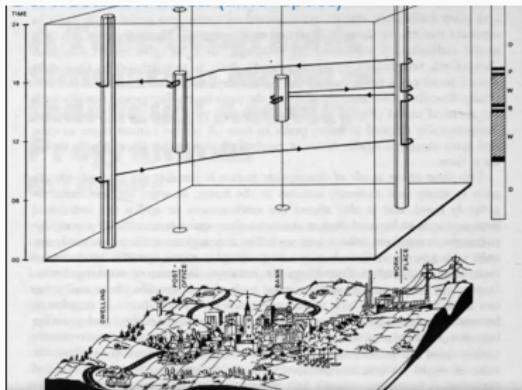

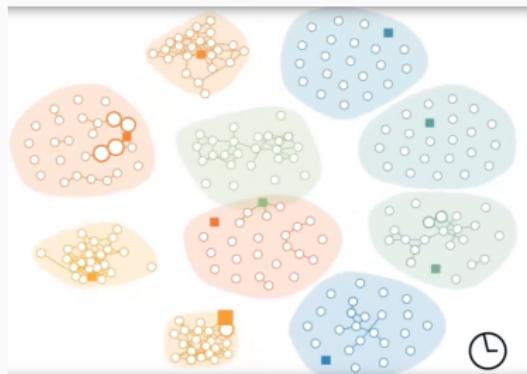

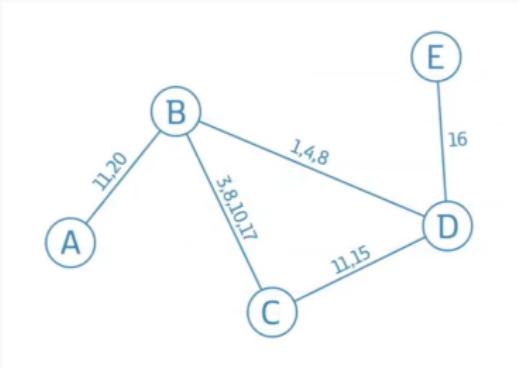

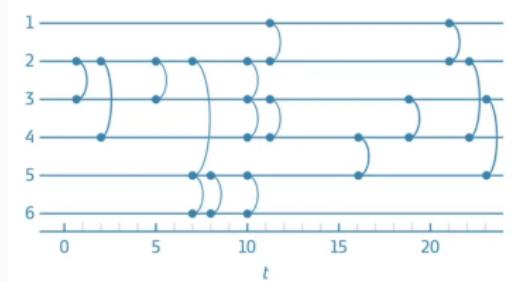

Abstract

Dissolved organic matter (DOM) is a complex mixture of thousands of natural molecules that undergo constant transformation in the environment, such as sunlight induced photochemical reactions. Despite molecular level resolution from ultrahigh resolution mass spectrometry (UHRMS), trends of mass peak intensities are currently the only way to follow photochemically induced molecular changes in DOM. Many real-world relationships and temporal processes can be intuitively modeled using graph data structures (networks). Graphs enhance the potential and value of AI applications by adding context and interconnections allowing the uncovering of hidden or unknown relationships in data sets. We use a temporal graph model and link prediction to identify transformations of DOM molecules in a photo-oxidation experiment. Our link prediction algorithm simultaneously considers educt removal and product formation for molecules linked by predefined transformation units (oxidation, decarboxylation, etc.). The transformations are further weighted by the extent of intensity change and clustered on the graph structure to identify groups of similar reactivity. The temporal graph is capable of identifying relevant molecules subject to similar reactions and enabling to study their time course. Our approach overcomes previous data evaluation limitations for mechanistic studies of DOM and leverages the potential of temporal graphs to study DOM reactivity by UHRMS.

How to represent time in graphs?

How to model temporal graphs

Definition labeled graphs

Definition

A **labeled graph** [? , page 94] is a triple $G = (V, E, \lambda)$ where:

- V, E is a graph
- $\lambda : V \cup E \rightarrow Z$ is a mapping of nodes and edges to a set of labels Z

Definition temporal graphs

Definition

A **temporal graph** [? , page 243] is a triple $G = (V, E, \lambda)$ where:

- V, E is a graph
- $\lambda : E \rightarrow 2^{\mathbb{N}}$ is a mapping edges to a set of natural numbers
(time steps when this edge is active)

Notation for convenience → [? , p. 243ff]

- $\lambda(G)$ - temporal graph with respect to G
- $\lambda(E)$ - multiset of all labels
- $|\lambda| = \sum_{e \in E} |\lambda(e)|$
- $\lambda_{min} = \min\{l \in \lambda(E)\}$
- $\lambda_{max} = \max\{l \in \lambda(E)\}$
- $\alpha(\lambda) = \lambda_{max} - \lambda_{min} + 1$ - lifetime of a temporal graph $\lambda(G)$

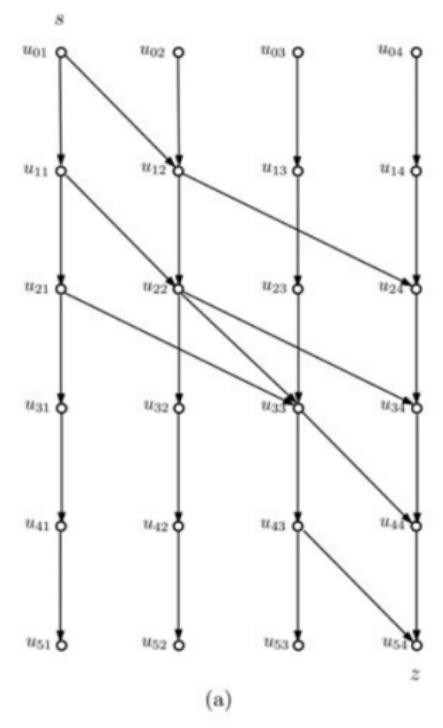

Time matters!

- not transitive

Notation 2

- A temporal graph D is a an ordered set of disjoint sets (V, A)
- $A \subseteq V^2 \times \mathbb{N}$ - 'time edges'
- $A(t) = \{e | (e, t) \in A\}$ - set of edges at time t
- $D(t) = (V, A(t))$ - snapshot of graph D at time t

Static expansion of a temporal graph

[? , page 318]

Static expansion of a temporal graph

Definition: static expansion of a graph

The static expansion of a temporal graph $D = (V, A)$ with $V = \{u_1, u_2, \dots, u_n\}$ is a DAG $H = (S, E)$ with:

$$S = \{u_{ij} \mid \lambda_{min} - 1 \leq i \leq \lambda_{max}, 1 \leq j \leq n\}$$

and

$$\begin{aligned} E = \{ & (u_{(i-1)j}, u_{ij'}) \mid \lambda_{min} \leq i \leq \lambda_{max} \wedge \\ & 1 \leq j, j' \leq n \wedge (j = j' \vee (u_j, u_{j'}) \in A(i)) \} \end{aligned}$$

Definition: temporal/time respecting walk

A **temporal** or **time-respecting walk** W of a temporal graph $D = (V, A)$ is an alternating sequence of nodes and times $(u_1, t_1, u_2, t_2, \dots, u_{k1}, t_{k1}, u_k)$ where

- $\forall 1 \leq i \leq k - 1 : ((u_i, u_{i+1}), t_i) \in A$ and
- $1 \leq i \leq k2 : t_i < t_{i+1}$

- t_1 - departure time
- t_{k-1} arrival time
- $t_{k-1} - t_1 + 1$ - duration/temporal length

Definition: Journey

A **journey** is a temporal walk with pairwise distinct nodes
 \triangleq a journey of D is a path of the underlying static graph of D that uses strictly increasing edge-labels.

Definition: Foremost Journey

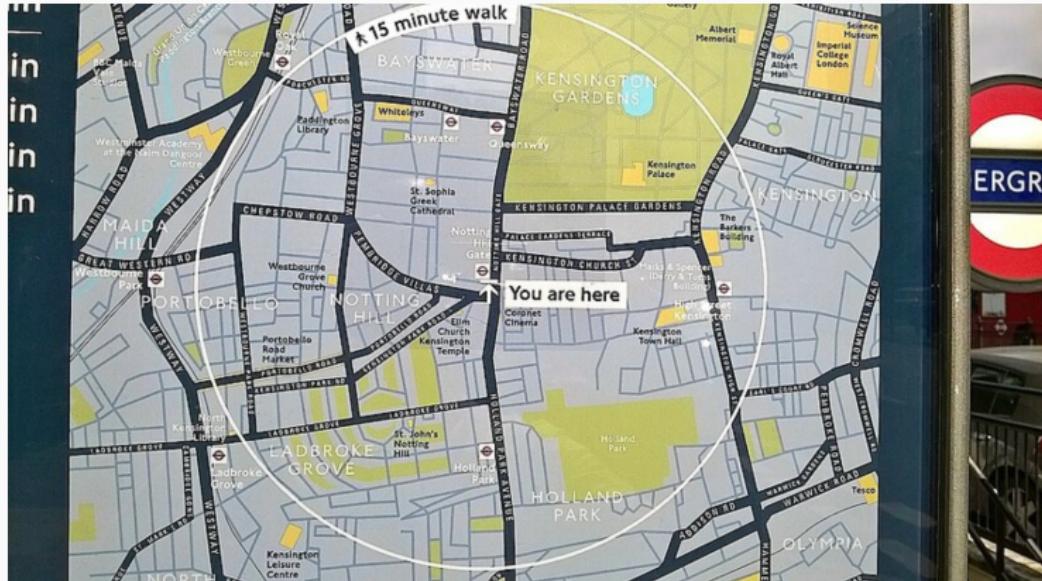

A u - v journey J is called foremost from time $t \in \mathbb{N}$ if it departs after time t and its arrival time is minimized.

Computing foremost journeys - Problem formulation

Computing foremost journeys - Algorithm

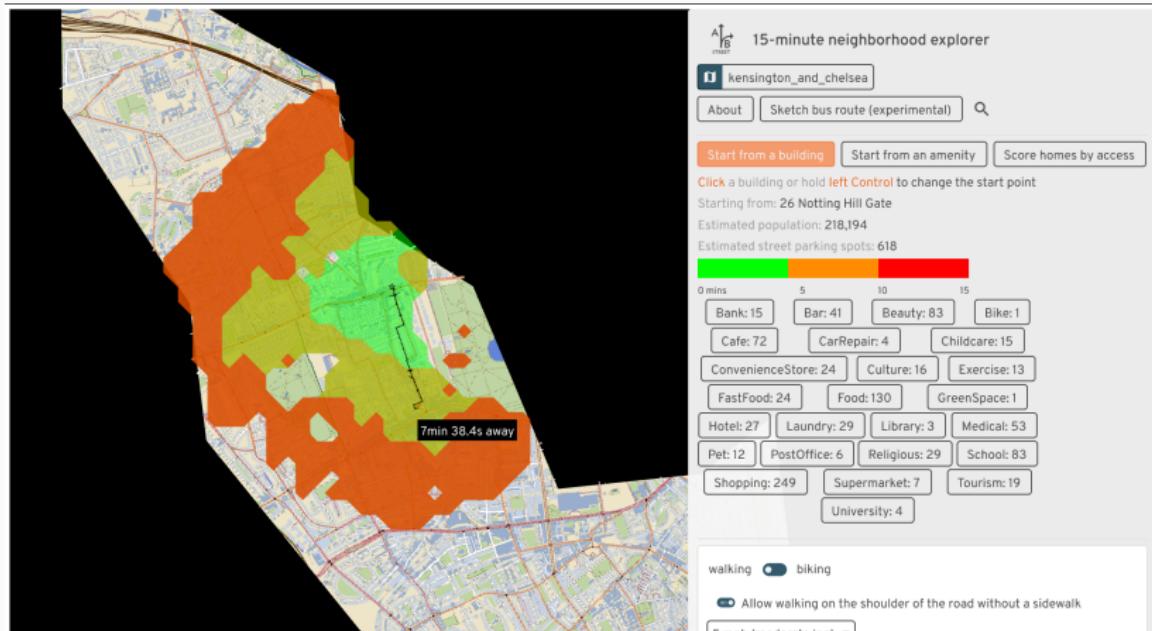

- k
